I Do Grow

I Do Grow will become an international B2B trading platform and commodity trader for natural, biobased, and future fermentation-based raw materials and products.

Our ambition is to remove barriers in the supply chain: from **farm to factory** and subsequently from **factory to shelf**. We connect farmers, producers, processors, factories, wholesalers, and retailers within one transparent trading ecosystem.

From farm to factory

I Do Grow initially works with natural fibre raw materials such as hemp, sisal, coir, jute, kenaf, and raffia. In the long term, the platform will expand to include raw materials and ingredients produced through precision fermentation, biomass fermentation, and cultivated production methods.

Farmers and producers can offer their available raw materials on the platform. Factories, processors, and other industrial buyers can then purchase these raw materials directly.

I Do Grow supports the entire trading process, including:

- sourcing and onboarding of farmers and producers;
- standardisation of product and quality data;
- quality control and classification;
- matching supply and demand;
- pricing and negotiations;
- contracting and transaction processing;
- transport and freight;
- traceability and documentation;
- payments and settlement;
- compliance and the Digital Product Passport.

As a result, buyers no longer need to approach dozens of farmers, producers, processors, and logistics providers individually. Instead, they can compare and purchase raw materials in one environment based on price, quality, volume, availability, location, and total logistics cost.

From factory to retailer

After a factory processes raw materials into semi-finished or finished products, these products can be offered again on the same platform.

Wholesalers, brands, retailers, and other buyers can then purchase these products. This creates a single trading platform where products can move through different stages of the value chain:

Farmer or producer → raw material → processor or factory → semi-finished or finished product → wholesaler or retailer → consumer

The platform makes visible where a product comes from, which processing steps it has undergone, which parties are involved in the process, and which quality, sustainability, and logistics data are available.

Digital Product Passport

A key component of I Do Grow is the Digital Product Passport (DPP).

Throughout the entire supply chain, relevant data is linked to the product. This includes:

- origin and producer;
- raw materials used;
- batch and product data;
- quality and test results;
- production method;
- processing steps and processors;
- transport movements;
- sustainability and CO_2 data;
- certificates and quality standards;
- composition and possible applications;
- information on reuse, recycling, or end-of-life processing.

This creates a fully traceable and transparent supply chain. Producers, buyers, and retailers can use this data for compliance, quality assurance, reporting, procurement decisions, and communication with end customers.

The Grand Exchange model

The platform is designed to operate according to the principle of the **Grand Exchange from RuneScape**.

Supply and demand are centrally matched. A buyer specifies the required product, quality, volume, delivery location, and price. The platform then automatically searches for the best available combination.

The final match is not determined solely by the product's selling price. The platform calculates the total cost of the transaction, including:

- purchase price;
- distance between supplier, processor, and buyer;
- quantity and volume;
- type of transport;
- freight capacity;
- loading and unloading costs;
- storage costs;
- import duties and taxes;
- quality control;
- processing and packaging;

- expected delivery time;
- supplier risk and reliability.

As a result, a cheaper product on the other side of the world may ultimately be less attractive than a slightly more expensive product located closer to the factory.

The platform should automatically and, as much as possible, in real time determine where a product is best sourced.

I Do Grow as a trader

I Do Grow is not only a software platform. We also operate as a trader and trading cooperative.

We can offer, sell, and bundle products on behalf of farmers and producers. We can also purchase raw materials ourselves, combine volumes, manage quality risks, and resell products to factories and other buyers.

I Do Grow's internal traders use the same platform as external customers. This ensures the platform is directly connected to real trading activity and that features are developed based on actual transactions and customer needs.

The revenue model may consist of a combination of:

- trading margins;
- transaction fees;
- commissions;
- subscriptions;
- quality control services;
- logistics services;
- storage and volume aggregation;
- DPP and traceability services;
- financing, insurance, and payment services.

Focus on small and medium-sized producers

I Do Grow specifically focuses on small and medium-sized farmers, producers, and production plants around the world.

Many of these parties have access to valuable raw materials and products but struggle to find international buyers. In addition, their product data, quality information, and documentation often do not meet the requirements of industrial buyers.

I Do Grow helps these producers make their offerings suitable for professional and international trade. This is achieved by:

- classifying products according to standardised frameworks;
- aggregating multiple small volumes;

- independently verifying quality;
- recording reliable product information;
- organising transport and export;
- providing access to international buyers;
- facilitating payments and contracts.

This gives smaller producers access to larger markets and gives factories access to a broader and more transparent supply base.

Mobile and WhatsApp accessibility

Not every farmer or producer has access to a computer or is familiar with complex software. Therefore, the platform must be extremely easy to use and fully functional on mobile devices.

Suppliers should be able to register products via:

- a mobile website or app;
- WhatsApp;
- photos and videos;
- voice messages;
- simple forms;
- support from local agents or traders.

For example, a farmer can send photos of a product, available quantity, location, harvest date, and moisture measurement via WhatsApp. An AI agent or trader can then automatically convert this information into a standardised product listing on the platform.

Our internal traders can also enter and manage products on behalf of farmers and producers. This ensures the platform remains accessible to parties with limited digital capabilities.

AI-powered quality control

To make products tradable internationally, quality must be assessed as accurately as possible in advance.

I Do Grow is developing quality agents that combine product data, images, measurements, certificates, and historical data. These agents can help with:

- identifying product types;
- assessing colour, structure, and contamination;
- checking moisture levels;
- classifying quality;
- detecting potential anomalies;
- determining suitable applications;
- flagging when physical inspection is required.

The first concrete application is a quality agent for European hemp. This focuses on retted hemp straw and later on decorticated hemp fibres for applications such as insulation and nonwoven materials.

The underlying data model is designed so that the same infrastructure can later be used for other fibres, raw materials, semi-finished goods, and production methods.

The core of I Do Grow

I Do Grow makes fragmented and difficult-to-compare raw materials suitable for professional and international trade.

We combine:

- a digital marketplace;
- commodity trading;
- quality control;
- AI agents;
- logistics;
- traceability;
- the Digital Product Passport;
- payments and transaction processing.

Together, this forms a single infrastructure through which raw materials and products can move transparently across the entire value chain: from farmer or production plant to factory, and from factory to retail shelf.

The core promise is:

To find the best available raw material or product based on quality, price, volume, location, logistics, and reliability — and to make the entire transaction as simple as possible.
